	*** Notes of Significance ***  Fires highlighted in yellow have submitted a FINAL ICS-209 or will no longer meet criteria to be prioritized																

# **Evening Brief**

Date: Sunday September 27th, 2020

## Weather Summary

Strong northerly winds expected early Monday across southern Nevada and adjacent areas of far southwest Utah and the Arizona Strip. These winds could gust over 30 mph and will be occurring with poor overnight humidity recoveries less than 35%.

Otherwise, this week will be characterized by a significant warming/drying trend, as an unusually strong high pressure ridge along the West Coast will build eastward across the Great Basin starting today, and continuing into the entire week. Afternoon temperatures will be 5-10 degrees above normal, along with afternoon humidity levels ranging from 10-17% across the southern half of the Great Basin, and 17-23% across northern areas. Fortunately, no significant winds, or lightning is expected during this time.

#### Preparedness Levels & Great Basin Fire Activity (from WFDSS)

Great Basin	PL 4	Light Initial Attack Activity
National	PL 5	New Fires and Acres: 11 fires for 153.4 acres. 1,126 acres Large Fire Growth

#### Fuels/Fire Potential

Recent moisture and cool temperatures across northern and eastern areas have raised fuel moisture temporarily. ERC's, which just a few days ago were at record dry levels across Idaho, Wyoming and eastern Utah, have rapidly fallen back to near late September normals.

Otherwise, fuels will remain critical over most of the southern half of the Great Basin under drier conditions. Light precipitation across Central Idaho into western Wyoming could raise fuel moisture even more by Friday/Saturday.

Live Fuel moisture in low elevation brush remains critically dry, between 60-100% in most areas, which correlates with extreme fire behavior.

In the long range, much above normal temperatures and very dry conditions by the end of the weekend into next week will bring about more rapid drying of fuels in most areas across the Great Basin. Fuels in the Western half of the Great Basin could once again reach near record level dryness.
